

# Writing Small Numbers in Scientific Notation

---

**MA.8.NSO.1.4**

*I can write very small numbers in scientific notation, read them back, and find how many times larger or smaller one number is than another.*

*Yesterday the exponents on the 10 were positive.*

**Today they are negative — and the numbers get very small.**

# Warm-Up

---

*On your own. Four minutes. No notes.*

1. Write 4,300,000 in scientific notation.
2. Write  $10^{-3}$  as a fraction.
3.  $\sqrt{95}$  is between which two whole numbers?
4. Write 0.007 as a fraction.

# Warm-Up

---

*Answers.*

1. Write 4,300,000 in scientific notation.  **$4.3 \times 10^6$**
2. Write  $10^{-3}$  as a fraction.  **$\frac{1}{1,000}$**
3.  $\sqrt{95}$  is between which two whole numbers? **9 and 10**
4. Write 0.007 as a fraction.  **$\frac{7}{1,000}$**

# Notes

---

*Copy the table.*

## I. Negative powers of ten name the decimal places

---

| $10^0$ | $10^{-1}$ | $10^{-2}$ | $10^{-3}$ | $10^{-4}$ | $10^{-5}$ |
|--------|-----------|-----------|-----------|-----------|-----------|
| 1      | 0.1       | 0.01      | 0.001     | 0.0001    | 0.00001   |

$$10^{-n} = \frac{1}{10^n}$$

$$10^{-3} = \frac{1}{1,000} = 0.001$$

**A negative exponent puts the 1 in that decimal place:  $10^{-4}$  is a 1 in the fourth place.**

# Notes

---

## II. Small numbers in scientific notation

---

$$0.000007 = 7 \times 10^{-6}$$

$$0.0000672 = 6.72 \times 10^{-5}$$

$$3.4 \times 10^{-9} = 0.0000000034$$

**The coefficient is still at least 1 and less than 10. The exponent is negative for a number less than 1.**

The exponent is how many places the point moves:  $0.0000672 \rightarrow 6.72$  is five places right, so  $10^{-5}$ .

# Notes

---

## III. How many times larger — or smaller?

---

$$\frac{7.2 \times 10^{-4}}{1.8 \times 10^{-7}} = 4 \times 10^3 = 4,000$$

$$\frac{3 \times 10^8}{3 \times 10^{-4}} = 10^{12}$$

**Divide the coefficients. Divide the powers of 10 — subtract the exponents. Multiply the results.**

Which is bigger,  $10^{-5}$  or  $10^{-8}$ ? The one with the larger exponent:  $-5 > -8$ , so  $10^{-5}$ .

# Example 1

---

*A quantity in words, to scientific notation.*

The density of oxygen is 1,332 millionths of a gram per cubic centimeter.

Write this value as a decimal, then in scientific notation.

# Example 1

---

*Worked.*

$$\frac{1,332}{1,000,000} = 0.001332 \quad \text{1,332 millionths, as a decimal}$$

$$0.001332 = 1.332 \times 10^{-3} \quad \text{the 1 is in the thousandths place}$$

$$\textbf{Answer: } 0.001332 = 1.332 \times 10^{-3}$$

# Your Turn

---

*Same steps, your numbers. Boards up when done.*

A human hair is about 67 hundred-thousandths of an inch thick.

Write this value in scientific notation.

# Your Turn

Write this value in scientific notation.

0.00067 — the 6 is in the ten-thousandths place

**Answer:  $6.7 \times 10^{-4}$**

# Example 2

---

*How many times larger?*

How many times larger is  $7.2 \times 10^{-4}$  than  $1.8 \times 10^{-7}$  ?

# Example 2

---

*Worked.*

$$\frac{7.2}{1.8} = 4 \quad \text{coefficients}$$

$$\frac{10^{-4}}{10^{-7}} = 10^{-4 - (-7)} = 10^3 \quad \text{powers of 10: } -4 - (-7) = 3$$

$$4 \times 10^3 = 4,000 \quad \text{multiply the two results}$$

**Answer: 4,000 times larger**

# Your Turn
